

MCCL Tool Manual

Technical Report

Duc Minh Le
duclm@hanu.edu.vn
Faculty of IT, Hanoi University

1. Introduction

This manual describes how to run a tool that implements an annotation-based DSL named MCCL. MCCL is developed for a current paper that is submitted to the KSE 2017 conference. It is implemented as part of a software tool named `jDomainApp` [1].

2. Installation

Download the MCCL binary from GitHub [2] and place it in a directory in the local hard drive. The binary basically includes a set of `jar` files that you can import and run directly in an IDE (e.g. Eclipse) or from the command line. Table 1 below describes the library files.

Note that the three test programs that we will focus on in this guide are those that test the MCC generator and the two MCC update functions that are discussed in the KSE 2017 paper.

Table 1: MCCL library files

Library file	Description
<code>domainapp.jar</code>	The <code>jDomainApp</code> tool [1]
<code>javaparser-core-3.2.5.jar</code>	The <code>JavaParser</code> tool [3]
<code>mccl.jar</code>	Implementation of MCCL and these three test programs for its three functions: <ul style="list-style-type: none">• <code>MCCGenTest</code>: test function <code>MCCGen</code>• <code>MCCAddFieldsTest</code>: test function <code>OnAddDomainFields</code>• <code>MCCUpdateFieldsTest</code>: test function <code>OnUpdateDomainFields</code>

In this guide, we will explain how to run these programs from the command line.

3. Example: CourseMan

The source code folder of CourseMan is provided in the file named `courseman-examples.zip`. The content of this source code is shown in Figure 1. In particular, package `modulesgen` is used to run the program `MCCGenTest`; while package `modulesupdate` is used to run the two programs `MCCAddFieldsTest` and `MCCUpdateFieldsTest` (resp.)

Figure 1:
CourseMan
source code
example.

Denote `$MCCL_SRC_EXAMPLES` by the directory of this source code tree.

4. Running the tool

All the programs described in this section can optionally be executed with the system property: `-Ddebug=MCCModel`. This helps turn on additional output messages on the console.

4.1. MCCGenTest

Command

```
java -DrootSrcPath=$MCCL_SRC_EXAMPLES -cp lib/domainapp.jar:lib/javaparser-core-3.2.5.jar:lib/mccl.jar
domainapp.modules.mccl.test.MCCGenTest
```

Run output

In this example:

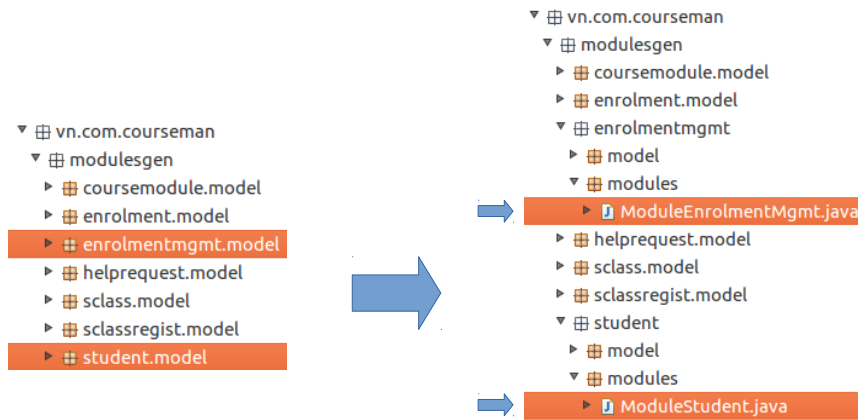

- `$MCCL_SRC_EXAMPLES = "/home/dmle/projects/domainapp/modules/mccl/src.examples"`

```
java -DrootSrcPath=/home/dmle/projects/domainapp/modules/mccl/src.examples -cp lib/domainapp.jar:lib/javaparser-core-
3.2.5.jar:lib/mccl.jar domainapp.modules.mccl.test.MCCGenTest
```

```
Running MCCGen...
  Domain class: vn.com.courseman.modulesgen.student.model.Student
  Source file:
/home/dmle/projects/domainapp/modules/mccl/src.examples/vn/com/courseman/modulesgen/student/model/Student.java
  Root class output dir: /home/dmle/projects/domainapp/modules/mccl/src.examples
...ok

Running MCCGen...
  Domain class: vn.com.courseman.modulesgen.enrolmentmgmt.model.EnrolmentMgmt
  Source file:
/home/dmle/projects/domainapp/modules/mccl/src.examples/vn/com/courseman/modulesgen/enrolmentmgmt/model/EnrolmentMgmt
.java
  Root class output dir: /home/dmle/projects/domainapp/modules/mccl/src.examples
...ok
```

Result

4.2. MCCAddFieldsTest

Preparation

Add two test domain fields to class `vn.com.courseman.modulesupdate.student.model.Student` as shown below. We expect that after executing this program, class `vn.com.courseman.modulesupdate.student.model.ModuleStudent` will have two view fields that reflect these two new domain fields.

```
//////// NEW FIELDS TO TEST //////////
@DAttr(name="test1",type=Type.String, serialisable=false)
private String test1;

@DAttr(name="test2",type=Type.String, serialisable=false)
private String test2;

//////// END new fields //////////
```

Command

```
java -DrootSrcPath=$MCCL_SRC_EXAMPLES -cp lib/domainapp.jar:lib/javaparser-core-3.2.5.jar:lib/mccl.jar
domainapp.modules.mccl.test.MCCAddFieldsTest
```

Run output

In this example:

- `$MCCL_SRC_EXAMPLES = "/home/dmle/projects/domainapp/modules/mccl/src.examples"`

```
java -DrootSrcPath=/home/dmle/projects/domainapp/modules/mccl/src.examples -cp lib/domainapp.jar:lib/javaparser-core-
3.2.5.jar:lib/mccl.jar domainapp.modules.mccl.test.MCCAddFieldsTest
```

Test data:

```
[vn.com.courseman.modulesupdate.student.model.Student, vn.com.courseman.modulesupdate.student.ModuleStudent]

[vn.com.courseman.modulesupdate.enrolmentgmt.model.EnrolmentMgmt,
vn.com.courseman.modulesupdate.enrolmentgmt.ModuleEnrolmentMgmt]
```

```
Creating MCCModel...
Executing onAddDomainFields...
    new fields: [test1, test2]
...ok
```

Result

- (1) Class ModuleStudent is updated with two new view fields (test1, test2).
- (2) Property ModuleDescriptor.containmentTree.stateScope of ModuleStudent is also updated with names of these two view fields.
- (3) Containment scope of Student in ModuleEnrolmentMgmt is updated with names of two new view fields

```
31 @ModuleDescriptor(name = "ModuleStudent",
32 modelDesc = @ModelDesc(model = Student.class),
33 viewDesc = @ViewDesc(domainClassLabel = "Student", formTitle = "Manage Students", image
34 isDataFieldStateListener = true),
35 containmentTree = @ContainmentTree(root = Student.class,
36 stateScope = { Student.A_id, Student.A_name, Student.A_modules, "test1", "test2"}),
37 type = ModuleType.DomainData, isViewer = true, isPrimary = true, childModules = { Moc
38 public class ModuleStudent {
39
40     @AttributeDesc(label = "Student")
41     private String title;
42
43     @AttributeDesc(label = "Id", alignX = AlignmentX.Center)
44     private int id;
45
46     @AttributeDesc(label = "Full name", alignX = AlignmentX.Center)
47     private String name;
48
49     @AttributeDesc(label = "Needs help?", alignX = AlignmentX.Center, isStateEventSource
50     private boolean helpRequested;
51
52     @AttributeDesc(label = "Enrols Into", type = JListField.class, modelDesc = @ModelDe
53     private Set<CourseModule> modules;
54
55     @AttributeDesc(label = "test1")
56     private String test1;
57
58     @AttributeDesc(label = "test2")
59     private String test2;
60 }
```

```

48 @ModuleDescriptor(name = "ModuleEnrolmentMgmt", modelDesc = @ModelDesc(model = Er
49 ViewDesc(//widthRatio=0.9f,heightRatio=0.9f,
50 formTitle = "Manage Enrolment Management", //widthRatio=0.9f,heightRatio=0.9f,
51 domainClassLabel = "Enrolment Management", //widthRatio=0.9f,heightRatio=0.9f,
52 imageIcon = "enrolment.jpg", //widthRatio=0.9f,heightRatio=0.9f,
53 view = View.class, //widthRatio=0.9f,heightRatio=0.9f,
54 viewType = Region.Type.Data, //widthRatio=0.9f,heightRatio=0.9f,
55 layoutBuilderType = TabLayoutBuilder.class, topX = 0.5, topY = 0.0, parent = Regi
56 Export, //New,
57 Print, //New,
58 Chart, //New,
59 Open, Update, Delete, First, Previous, Next, Last, ObjectScroll })),
60 controllerDesc = @ControllerDesc(controller = Controller.class),
61 containmentTree = @ContainmentTree(root = EnrolmentMgmt.class, subtrees = { // er
62 @SubTreeLL(parent = EnrolmentMgmt.class,
63 children = { @Child(cname = Student.class,
64 scope = { "id", "name", "helpRequested", "modules", "test1", "test2" }) }) },
65 public class ModuleEnrolmentMgmt {

```

4.3. MCCUpdateFieldsTest

Preparation

Change the names of the newly added domain fields of class `vn.com.courseman.modulesupdate.student.model.Student` from `test1` and `test2` to `testA` and `testB` (respectively) as shown below. We expect that after executing this program, the two view fields `test1` and `test2` of class `vn.com.courseman.modulesupdate.student.model.ModuleStudent` will have their names and labels updated accordingly. Further, the state scope of `ModuleStudent` and the containment scope of class `Student` in `ModuleEnrolmentMgmt` will also be updated accordingly.

```

//////// UPDATE FIELDS TO TEST //////////
@Data(name="testA",type=Type.String, serialisable=false)
private String testA;

@Data(name="testB",type=Type.String, serialisable=false)
private String testB;

//////// END fields //////////

```

Command

```

java -DrootSrcPath=$MCCL_SRC_EXAMPLES -cp lib/domainapp.jar:lib/javaparser-core-3.2.5.jar:lib/mccl.jar
domainapp.modules.mccl.test.MCCUpdateFieldsTest

```

Run output

In this example:

- `$MCCL_SRC_EXAMPLES = "/home/dmle/projects/domainapp/modules/mccl/src.examples"`

```

java -DrootSrcPath=/home/dmle/projects/domainapp/modules/mccl/src.examples -cp lib/domainapp.jar:lib/javaparser-core-
3.2.5.jar:lib/mccl.jar domainapp.modules.mccl.test.MCCUpdateFieldsTest

```

Test data:
`[vn.com.courseman.modulesupdate.student.model.Student, vn.com.courseman.modulesupdate.student.ModuleStudent]`

```
[vn.com.courseman.modulesupdate.enrolmentgmt.model.EnrolmentMgmt,
vn.com.courseman.modulesupdate.enrolmentgmt.ModuleEnrolmentMgmt]
```

```
Creating MCCModel...
```

```
Executing onUpdateDomainFields...
```

```
updatedFields fields: {testB=test2, testA=test1}
```

```
...ok
```

Result

- (1) Names and labels of two view fields test1, test2 of ModuleStudent are changed to testA, testB (resp.).
- (2) Property ModuleDescriptor.containmentTree.stateScope of ModuleStudent is also updated with the new names of the two view fields.
- (3) Containment scope of Student in ModuleEnrolmentMgmt is updated with the new names of the two view fields.

```
@ModuleDescriptor(name = "ModuleStudent", modelDesc = @ModelDesc(model = Student.class)
viewDesc = @ViewDesc(domainClassLabel = "Student", formTitle = "Manage Students", image
ControllerDesc(// listens to state change event of list field
controller = Controller.class, // listens to state change event of list field
openPolicy = OpenPolicy.I_C, isDataFieldStateListener = true),
containmentTree = @ContainmentTree(root = Student.class,
stateScope = { Student.A_id, Student.A_name, Student.A_modules, "testA", "testB" },
type = ModuleType.DomainData, isViewer = true, isPrimary = true, childModules = { Mod
public class ModuleStudent {

    @AttributeDesc(label = "Student")
    private String title;
